Preprint + Warning

In the following, we will present you with five short summaries of research findings that have each been published online as non-peer reviewed preprints. We kindly ask you to thoroughly read the summaries and then answer a question about the credibility of each result.

Since all manuscripts have been provided as non-peer reviewed preprints, the authors published the following information before each manuscript:

"Scientific articles usually go through a peer-review process. This means that independent researchers evaluate the quality of the work, provide suggestions, and speak for or against the publication. Please note that the present article has <u>not</u> (yet) undergone this standard procedure for scientific publications."

We kindly ask you to thoroughly read the summaries and then answer a question about the credibility of each result.

Claim1

Do people preserve common resources for future generations if they make collective decisions? In a game, participants chose how many resources they would extract from a pool, and how many they wanted to preserve for future game players. In one group, each participant made their own decision on how many resources they want to extract from the pool. In the other group, participants voted for the combined amount of resources they would extract.

Study result: If people had to vote on the combined amount of resources they would extract from the pool, more resources were preserved for future generations of game players.

Claim2

Are groups less likely to reduce inequality if the group members know the wealth of each other? In a

game, participants could share resources with co-players or keep it to themselves. At the start of the game, the resources were distributed unevenly between the players. In one group, participants saw the amount of resources of other players. In the other group, participants only saw their own resources. Study result: If participants knew the amount of resources from other players, the inequality between the players remained higher.

Claim5

Does poverty drain people's attention? Participants played the game "Wheel of Fortune", a game in which people have to guess letters in word puzzles. In one group, participants were given 6 chances per round to guess letters (i.e., 'poor' players). In the other group, participants were given 20 chances per round to guess letters (i.e., 'rich' players). Afterward, they completed an attention task. Study result: If participants were given only a few chances per round to guess letters, they performed worse in the subsequent attention task.
